

PRE-DEPLOYMENT COMPLIANCE ASSURANCE FOR REGULATED VOICE AI

ECHOPROOF

Every claim has a source.
Every verdict has a rule.
Every finding has evidence.

The model is ready. The signature is not.

Enterprises are putting voice AI into legally governed conversations. What stalls those launches is not capability. It is that somebody has to sign that the agent is safe, and has nothing to base it on.

THE CONSTRAINT IS NOT CAPABILITY. IT IS PROOF.

A manual process with a ceiling built into it.

Compliance review today is a person listening to recordings with a rulebook open beside them. EchoProof automates that process. It does not replace it with a new one.

MANUAL REVIEW COVERAGE, TODAY

1 to 5%

reviewed by hand

SAME REVIEW. EVERY TURN. BEFORE LAUNCH INSTEAD OF WEEKS AFTER.

Manual QA coverage and analyst throughput: published contact centre benchmarks, 2026

WHY IT CANNOT MOVE

A structural ceiling. Headcount moves it slightly and costs a great deal.

WITH ECHOPROOF

Every flag carries the governing rule, quoted, and a sealed record.

Read what the agent said. Find the provision that governs it. Decide from that text alone.

The model that decides never browses the corpus. It is handed one provision and answers from that text, which is what makes the answer checkable.

Six stages, from a proxy to a sealed record.

The judge is fenced in, on purpose.

Because the provision it was handed is stored alongside the verdict, a reviewer can disagree by reading. And when it is wrong, the failure is attributable to retrieval or to the judge, never to both.

Two decide. Three decline.

Never a pass or a fail. The three that decline route to a human reviewer and are counted apart from findings, so a refusal is never reported as a catch.

Tamper evident by construction, not by policy.

TRACEABILITY OF THE DECISION, NOT ONLY OF THE MODEL.

Published training lineage tells you where a model came from. This tells you where a decision came from, which is the question a regulator asks.

Offsets, to timestamps, to the sentence itself.

TRANSCRIPT, CHARACTER OFFSETS

Yes, please tell her that

she owes four thousand five hundred dollars on a collection account

and that she needs to call back today.

OFFSETS [5:147)

Deepgram Nova-3

WORD LEVEL TIMESTAMPS

FFMPEG SLICE

The flagged sentence

THE CLIP IS THE SENTENCE, NOT THE RECORDING
ADJUDICATION IS TEXT ONLY. AUDIO ATTACHES AFTER THE VERDICT

One endpoint. Any stack.

EchoProof attaches at a single point in front of the model call. The response is returned unmodified and never delayed, and adjudication runs to the side.

Between the build and the sign off.

The client owns the regulation. The delivery partner owns the agent and the operations. EchoProof produces the artifact that moves the sign off.

SAME LAYER REGARDLESS OF CLIENT, REGULATION OR VENDOR STACK

The regulation is an input to the system, not a rebuild of it.

Three routes, all of them existing motions.

ROUTE 01 / ATTACH

Existing CX engagements

Assurance becomes a line item on work already being won.

Shortest path. No new buyer.

ROUTE 02 / NEW

Audit agents others built

Vendor neutral means Hexaware can assess a stack it did not deliver.

New logos, no build risk.

ROUTE 03 / RECUR

Regulations change

The rulebook is an input. When it moves, the assessment re runs.

Recurring, not one off.

THE STRATEGIC ONE IS ROUTE TWO

OpenAI ships Presence through select global systems integrators. Assuring any agent, not only ones built on a single vendor, is the differentiator in that room.

A large market, and a small line item.

VOICE AI AGENT MARKET

Market: published industry forecasts 2026. Cost: measured campaign in this repository, projected at realistic call length.

MEASURED RUN COST

\$0.82
model spend, 18 call campaign

~\$23
projected per 100 call campaign

Model spend is not the constraint.

Nobody independent is checking before launch.

END TO END MEANS THE VENDOR GRADES ITSELF. CASCADED STACKS ARE NOT COVERED AT ALL.
